

Old Technology Becomes New Technology

Using organic fertilizers is not a new idea; the concept has been around for centuries. Squanto¹ and other Native Americans first taught the English settlers how to grow healthier and more bountiful crops by placing fish under a catch of corn. Combining the Native Americans' wisdom with today's technology has resulted in the development of H2H™ *harvest to harvest*, an organic soil enhancer and bio-stimulant.

H2H™ is an all-natural soil amendment manufactured by Organic Recovery, LLC. H2H™ is made from a renewable raw material source (fresh vegetable and fruit discards and meat and poultry trimmings) rather than from non-renewable petrochemical products used so extensively today. The exceptional consistency of our product results from the quality of our raw material input, our state-of-the-art processing equipment and highly trained and reliable production staff. The combination of these factors results in a high quality, sustainable, biological liquid fertilizer that can rebuild soils, provide for excellent plant growth, and produce higher production yields.

H2H's™ controlled enzyme hydrolysate process promotes the growth of bacteria and other organisms in the soil which provides supplementary macro- and micro-nutrients to the plants. In addition, soil qualities are improved for deeper rooting and better penetration of water and nutrients into plants. Together, these result in lower farming costs, reduced fertilizer costs, improved yields and better quality of harvested crops, grasses and plant material.

H2H™ can be soil applied, foliar applied, drip system applied and applied with all other forms of irrigation. Strict filtering and the low oil content of the product eliminate the chances for drip line clogging. H2H™ may be combined with additional soil enhancers such as potash and humates. Heavy applications of H2H™ will not burn roots or leaves because its nutrients are released slowly.

H2H™ will provide long lasting results with improvement in plant color, growth and overall health. H2H™ is a closely controlled, consistently high quality, food soil amendment....at an affordable price.

¹ <http://en.wikipedia.org/wiki/Squanto> Squanto, as he was called, stayed with the Pilgrims and helped them replenish their food. William Bradford wrote later that Squanto was a "special instrument sent by God for their good beyond their expectations." He helped them recover from their first difficult winter by teaching them the best places to catch fish and eel. He helped them to build warmer houses and taught them when and how to plant corn and how to cook it. As well as helping them fish and hunt for eel (a Native American delicacy) Squanto also advised the Pilgrims in their relations with the Wamponoag. He acted as interpreter, guided them on trading expeditions, and gave advice on bargaining and relations between the two groups.
